

Influence of the heteroatom on the properties and transistor performance of soluble thiophene-, selenophene- and tellurophene-vinylene copolymers

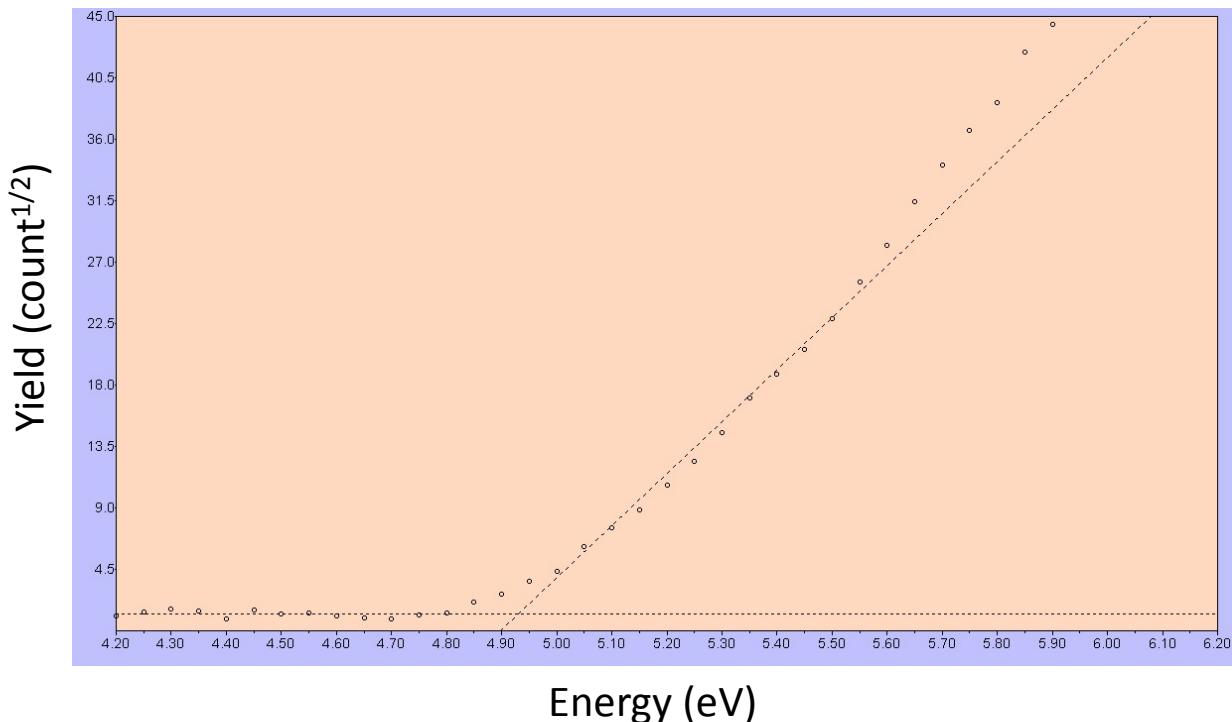

Figure S1. Photo Electron Spectroscopy in Air (PESA) spectra of a thin film of **P3TV**. The ionization potential was calculated by extrapolating a fit of the square root of the photoelectron emission yield as a function of excitation photon energy.

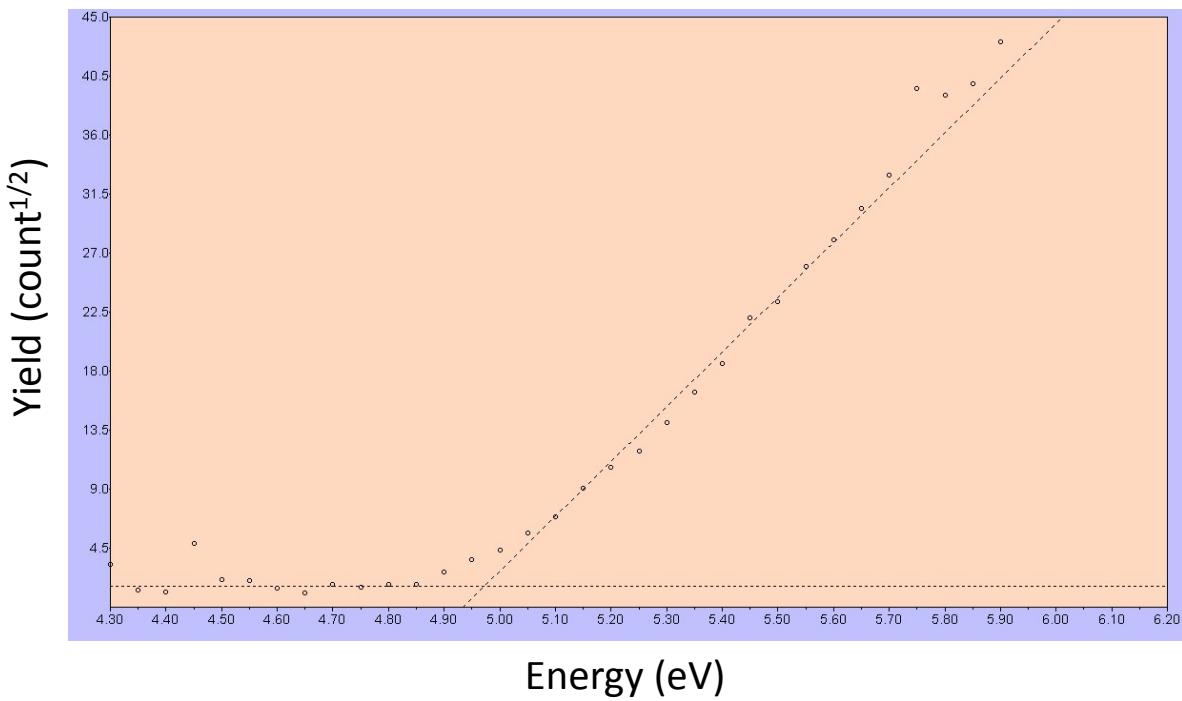

Figure S2. Photo Electron Spectroscopy in Air (PESA) spectra of a thin film of **P3SV**. The ionization potential was calculated by extrapolating a fit of the square root of the photoelectron emission yield as a function of excitation photon energy.

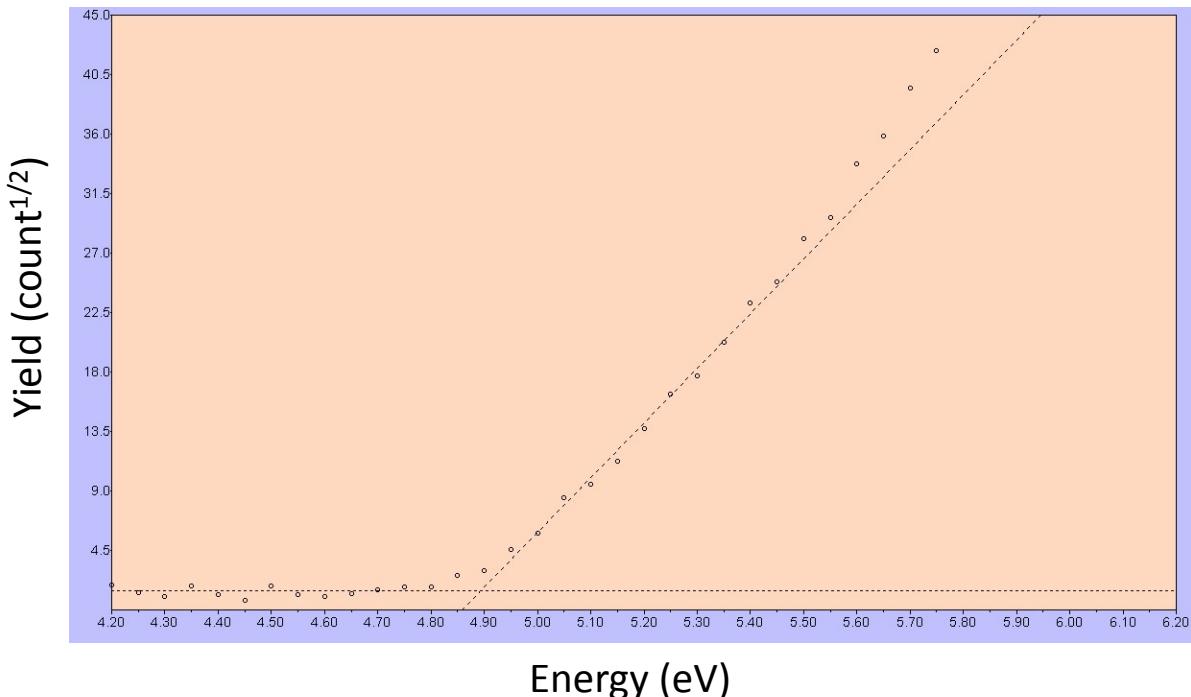

Figure S3. Photo Electron Spectroscopy in Air (PESA) spectra of a thin film of **P3TeV**. The ionization potential was calculated by extrapolating a fit of the square root of the photoelectron emission yield as a function of excitation photon energy.

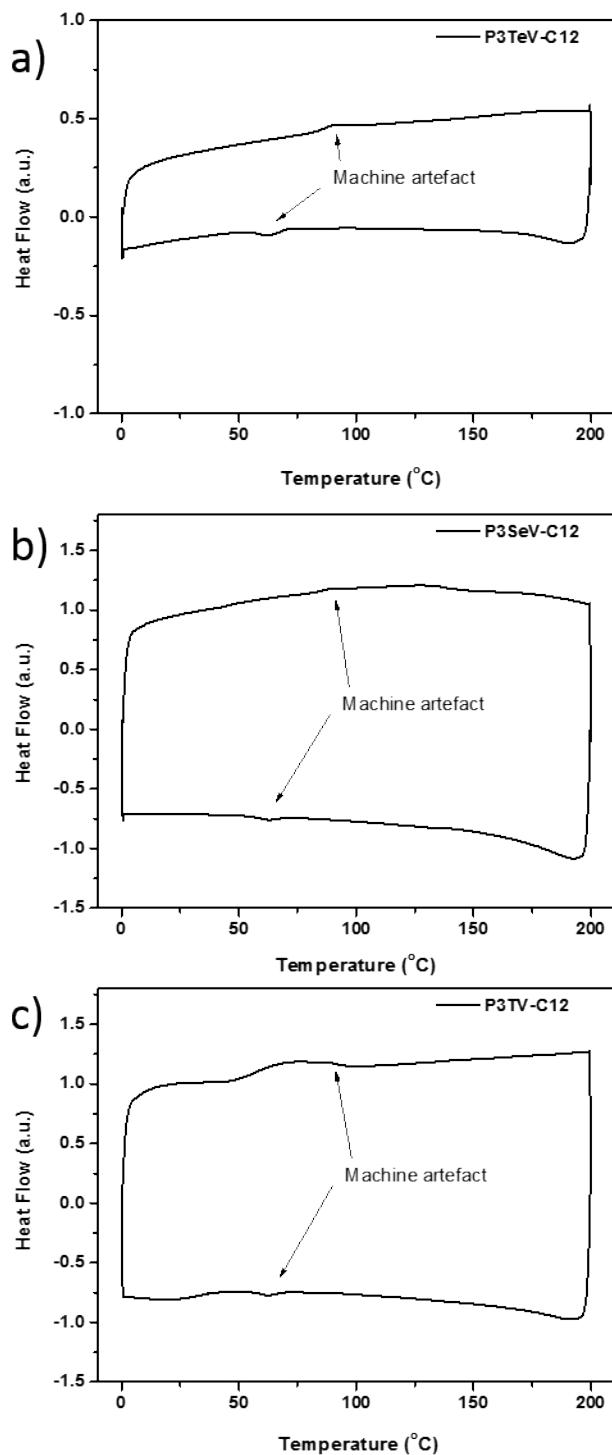

Figure S4. DSC plots (endo up) of a) P3TeV b) PSV and c) P3TV recorded at a heating and cooling rate of $10\text{ }^{\circ}\text{C min}^{-1}$ under nitrogen (second cycle).

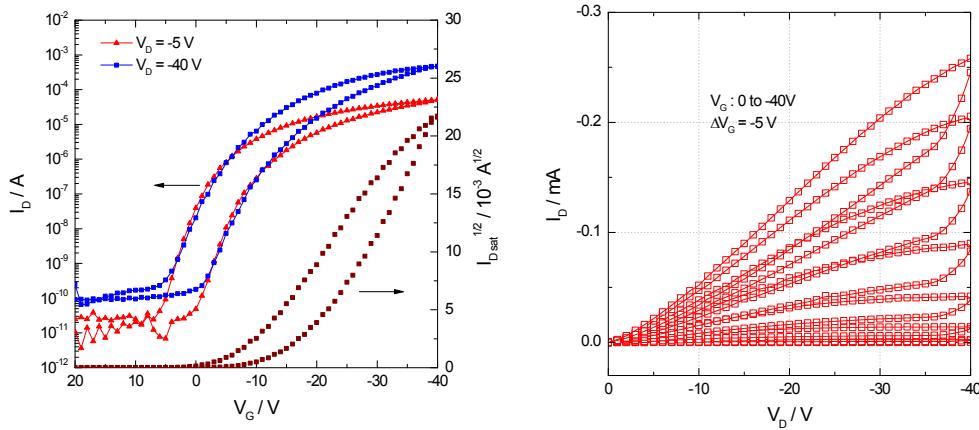

Figure S5. BG/BC transfer and output plots of P3SV.

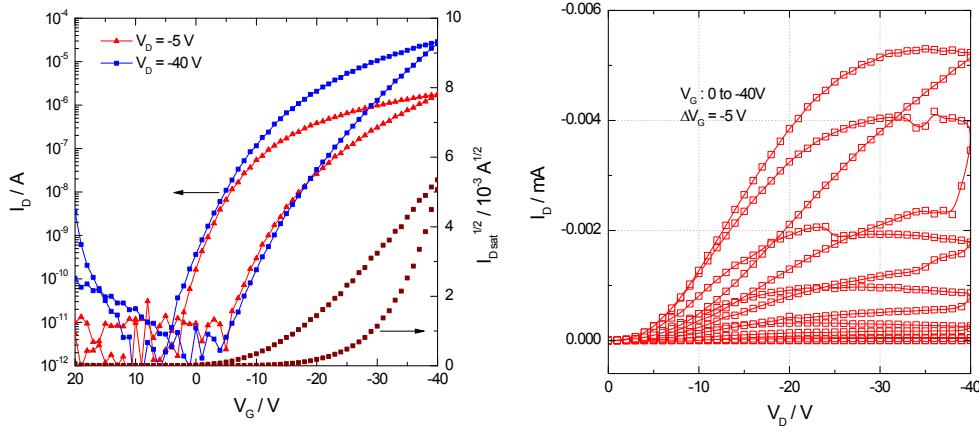

Figure S6. BG/BC transfer and output plots of P3TeV.

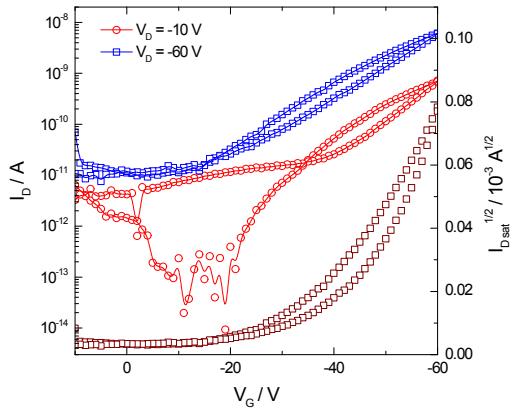

Figure S7. TG/BC transfer plots P3TV (channel length = 30 μm , width = 1000 μm)

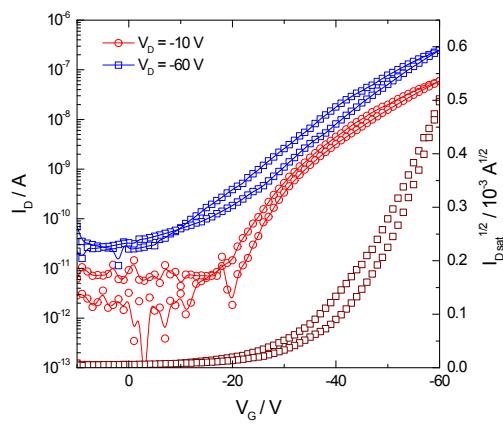

Figure S8. TG/BC transfer plots **P3SV** (channel length = 50 μm , width = 1000 μm)

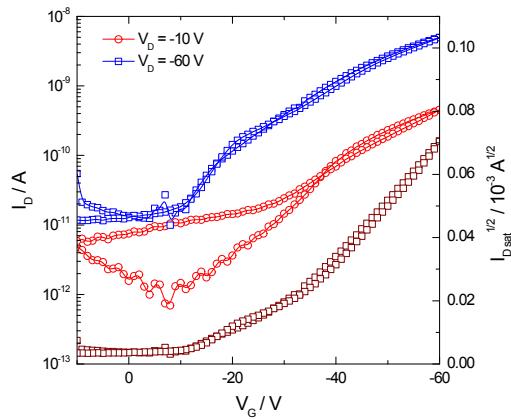

Figure S9. TG/BC transfer plots **P3TeV** (channel length = 50 μm , width = 1000 μm)

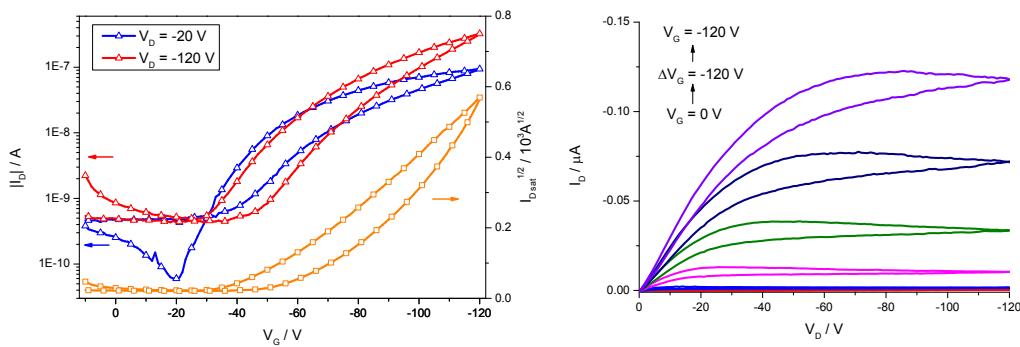

Figure S10. BG/TC transfer and output plots **P3TV**

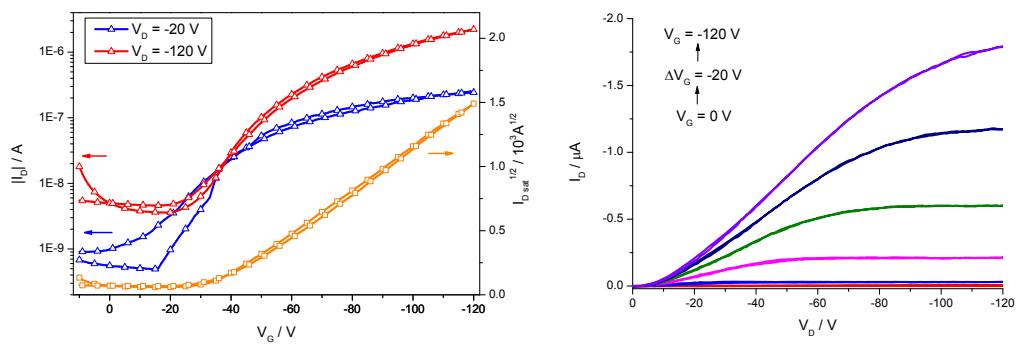

Figure S11. BG/TC transfer and output plots **P3SV**
